AMENDMENTS TO THE CLAIMS

Please amend the claims as follows:

1. (CURRENTLY AMENDED) An order processing method used in an

image output service for a digital camera, the order processing method

comprising the steps of:

obtaining image data by photographing an image and recording the

image data into a recording medium or by reading the image data from the

recording medium;

replaying the obtained image data as a visible image on a display

medium;

receiving an output instruction regarding the image data, the output

instruction being input from an input apparatus based on the replay of the

image data;

generating order information describing the output instruction in a

predetermined data format and recording the order information in the

recording medium;

displaying on the display medium all image data output of which has

been instructed and the content of the instruction regarding the image data so

that a requester of the image output service can confirm the content of the

output instruction;

certifying an order by recording confirmed order information in the recording medium when a predetermined order confirmation operation indicating that the requester has confirmed the content of the output

instruction; and

carrying out the image output service based on the order information recorded in the recording medium only when the confirmed order information has been recorded in the recording medium,

wherein the image is taken without the use of a photographic film.

2. (CURRENTLY AMENDED) An order processing system used in an image output service, the order processing system comprising an order information generating apparatus and an order receiving apparatus,

the order information generating apparatus comprising:

data obtaining means for obtaining image data by photographing an image and recording the image data into a recording medium or by reading the image data from the recording medium;

display means for carrying out replay of the obtained image data as a visible image on a display medium;

instruction receiving means for receiving an output instruction regarding the image data, the output instruction being

input from an input apparatus based on the replay of the image

data;

order information recording means for generating order

information describing the output instruction in a predetermined

data format and recording the order information in a recording

medium;

order content confirming means for displaying on the display

medium all image data, output of which has been instructed and

the content of the instruction regarding the image data so that a

requester of the image output service can confirm the content of

the output instruction; and

order certifying means for certifying an order by recording

confirmed order information in the recording medium when a

predetermined order confirmation operation indicating that the

requester has confirmed the content of the output instruction,

wherein the image is taken without the use of

photographic film;

the order receiving apparatus comprising:

data reading means for reading the order information

recorded in the recording medium;

*Page 5 of 25* 

confirmed information certifying means for certifying

whether or not the confirmed order information has been recorded

in the recording medium; and

output instructing means for instructing, based on the order

information recorded in the recording medium, output of the image

data to various kinds of output apparatuses only when the

confirmed order information has been recorded in the recording

medium.

3. (CURRENTLY AMENDED) An order information generating

apparatus for a digital camera comprising:

data obtaining means for obtaining image data by photographing an

image and recording the image data into a recording medium or by reading the

image data from the recording medium;

display means for carrying out replay of the obtained image data as a

visible image on a display medium;

instruction receiving means for receiving an output instruction regarding

the image data, the output instruction being input from an input apparatus

based on the replay of the image data;

order information recording means for generating order information

describing the output instruction in a predetermined data format and recording

the information in a recording medium;

order content confirming means for displaying on the display medium all

image data output of which has been instructed and the content of the

instruction regarding the image data so that a requester of an image output

service can confirm the content of the output instruction; and

order certifying means for certifying an order by recording confirmed

order information in the recording medium when a predetermined order

confirmation operation indicating that the requester has confirmed the content

of the output instruction,

wherein the data obtaining means, the display means, the instruction

receiving means, the order information recording means, the order content

confirming means, and the order certifying means are physically integrated in a

single body of the digital camera,

wherein the image is taken without the use of a photographic film.

4. (CURRENTLY AMENDED) An order receiving apparatus for use

with a digital camera, which receives an order for an image output service by

obtaining order information in a digital format, the order receiving apparatus

comprising:

data reading means for reading the order information describing an

output instruction regarding image data from a recording medium;

confirmed information certifying means for certifying whether or not

confirmed order information indicating that a requester of the image output

service has confirmed the content of the output instruction is recorded in the

recording medium; and

output instructing means for instructing, based on the order information

recorded in the recording medium, output of the image data to various kinds of

output apparatuses only when the confirmed order information is recorded in

the recording medium,

wherein the image is taken without the use of a photographic film.

5. (CURRENTLY AMENDED) A digital camera having an order

information generating function, the digital camera comprising:

photographing means for obtaining image data by photographing an

image;

image recording means for recording the image data having been

obtained in a recording medium;

display means for carrying out replay of the obtained image data as a

visible image on a monitor attached to the digital camera;

instruction receiving means for receiving an output instruction regarding

the image data, the output instruction being input from an operation button or

the like based on the replay of the image data;

order information recording means for recording order information

describing the output instruction in a predetermined data format in the

recording medium;

order content confirming means for displaying on the monitor all image

data output of which has been instructed and the content of the instruction

regarding the image data so that a requester of an image output service can

confirm the content of the output instruction; and

order certifying means for certifying an order by recording confirmed

order information in the recording medium when a predetermined order

confirmation operation indicating that the requester has confirmed the content

of the output instruction,

wherein the photographing means, the image recording means, the

display means, the instruction receiving means, the order information

Page 9 of 25

recording means, the order content confirming means, and the order certifying

means are physically integrated in a single body of the digital camera, and

wherein the image is taken without the use of a photographic film.

6. (PREVIOUSLY PRESENTED) A digital camera having the order

information generating function as claimed in Claim 5, the digital camera

further comprising confirmation operation canceling means for canceling the

order confirmation operation when the confirmed order information is updated

after having been recorded in the recording medium and/or when deletion of

image data representing at least one image recorded in the recording medium

is carried out.

7. (ORIGINAL) A digital camera having the order information

generating function as claimed in Claim 6, wherein the confirmation operation

canceling means deletes the order information when all image data, output of

which has been instructed, are deleted from the recording medium as a result

of the deletion.

8. (PREVIOUSLY PRESENTED) A digital camera having the order

information generating function as claimed in claim 5, wherein the order

Page 10 of 25

information recording means describes the order information in an order file

and records the order file in the recording medium, and

the order certifying means certifies an order by setting a hidden property

of the order file to visible.

9. (PREVIOUSLY PRESENTED) A digital camera having the order

information generating function as claimed in claim 5, wherein the order

information recording means describes the order information in an order file

and records the order file in the recording medium, and

the order certifying means certifies an order by setting a read/write

property of the order file to read-only.

10. (PREVIOUSLY PRESENTED) A digital camera having the order

information generating function as claimed in claim 5, wherein the order

information recording means describes the order information in an order file

and records the order file in the recording medium, and

the order certifying means certifies an order by describing a valid date as

order file generation date in the order file.

11. (PREVIOUSLY PRESENTED) A digital camera having the order

information generating function as claimed in claim 5, wherein the order

Page 11 of 25

information recording means describes the order information in an order file

and records the order file in the recording medium, and

the order certifying means certifies an order by describing a code

meaning order confirmation completion in the order file.

12. (PREVIOUSLY PRESENTED) A digital camera having the order

information generating function as claimed in claim 5, wherein the image

recording means records image data representing each image as an image file

in the recording medium, and

the order information recording means records the order information as

accompanying information included in the image file, and

the order certifying means certifies an order by describing a code

meaning order confirmation completion in at least one image file in the

recording medium.

13. (PREVIOUSLY PRESENTED) A digital camera having the order

information generating function as claimed in claim 5, the digital camera

further comprising operation urging means for carrying out display for

prompting the order confirmation operation execution by the requester.

Page 12 of 25

14. (ORIGINAL) A digital camera having the order information

generating function as claimed in Claim 13, wherein the display is a message

output on the monitor.

15. (PREVIOUSLY PRESENTED) A digital camera having the order

information generating function as claimed in Claim 13, wherein the operation

urging means carries out the display for a predetermined period after an

operation to switch off a power of the digital camera has been carried out, and

switches the power off after the predetermined period has elapsed.

16. (PREVIOUSLY PRESENTED) A digital camera having the order

information generating function as claimed in Claim 13, wherein the recording

medium is detachable from a body of the digital camera and the operation

urging means carries out the display when the recording medium is pulled out

from the body of the digital camera.

17. (PREVIOUSLY PRESENTED) The digital camera of claim 5, wherein

the photographing means comprises recording mode means for enabling

selection of one of printing and non-printing modes, wherein in the printing

mode, the photographing means is set at maximum resolution.

- 18. (PREVIOUSLY PRESENTED) The digital camera of claim 17, wherein in the non-printing mode, the photographing means allows manual setting of resolution and compression.
- 19. (PREVIOUSLY PRESENTED) The order processing method of claim 1,

wherein the digital camera is capable of directly taking an image of a real object, and

wherein the display medium is capable of displaying the image of the real object when the image is taken and during order processing.

20. (PREVIOUSLY PRESENTED) The order processing system of claim 2,

wherein the digital camera is capable of directly taking an image of a real object, and

wherein the display means is capable of displaying the image of the real object when the image is taken and during order processing.

21. (PREVIOUSLY PRESENTED) The order information generating apparatus of claim 3,

wherein the digital camera is capable of directly taking an image of a real object, and

wherein the display means is capable of displaying the image of the real object when the image is taken and during order processing.

22. (PREVIOUSLY PRESENTED) The order receiving apparatus of claim 4,

wherein the digital camera is capable of directly taking an image of a real object, and

wherein a display of the digital camera is capable of displaying the image of the real object when the image is taken and during order processing.

23. (PREVIOUSLY PRESENTED) The digital camera of claim 5, wherein the digital camera is capable of directly taking an image of a real

wherein the display means is capable of displaying the image of the real object when the image is taken and during order processing.

object, and

Page 15 of 25

24. (PREVIOUSLY PRESENTED) The order processing method of

claim 1, wherein the steps of obtaining the image data, replaying the image

data, receiving the output instruction, generating the order information,

displaying on the display medium all image data output, and certifying the

order are carried out by means all integrated physically within a single body of

the digital camera.

25. (PREVIOUSLY PRESENTED) The order processing method of

claim 1, further comprising selecting for an image recording mode one of a

printing mode and a non-printing mode based on a selection from a user,

wherein a still image is recordable in the non-printing mode.

26. (PREVIOUSLY PRESENTED) The order processing method of claim

1, wherein when the image data is obtained by photographing the image, the

image data is obtained without a need for conversion from a negative image to

a positive image.

27. (PREVIOUSLY PRESENTED) The order processing method of claim

1, wherein the step of photographing the image includes adjustably focusing

the image prior to photographing the image.

Page 16 of 25

28. (PREVIOUSLY PRESENTED) The order processing system of

claim 2, wherein the data obtaining means, the display means, the instruction

receiving means, the order information recording means, the order content

confirming means, and the order certifying means are physically integrated in a

single body of the digital camera.

29. (PREVIOUSLY PRESENTED) The order processing system of

claim 2, further comprising a recording mode selector for selecting for an image

recording mode one of a printing mode and a non-printing mode based on a

selection from a user, wherein a still image is recordable in the non-printing

mode.

30. (PREVIOUSLY PRESENTED) The order processing system of

claim 2, wherein when the image data is obtained by photographing the image,

the image data is obtained without a need for conversion from a negative image

to a positive image.

31. (PREVIOUSLY PRESENTED) The order processing system of

claim 2, wherein the data obtaining means includes an adjustable focusing

mechanism capable of adjustably focusing the image prior to photographing

the image.

32. (PREVIOUSLY PRESENTED) The order information generating

apparatus of claim 3, further comprising a recording mode selector for selecting

for an image recording mode one of a printing mode and a non-printing mode

based on a selection from a user, wherein a still image is recordable in the non-

printing mode.

33. (PREVIOUSLY PRESENTED) The order information generating

apparatus of claim 3, wherein when the image data is obtained by

photographing the image, the image data is obtained without a need for

conversion from a negative image to a positive image.

34. (PREVIOUSLY PRESENTED) The order information generating

apparatus of claim 3, wherein the data obtaining means includes an adjustable

focusing mechanism capable of adjustably focusing the image prior to

photographing the image.

35. (PREVIOUSLY PRESENTED) The order receiving apparatus of

claim 4, wherein each image data are recorded in the recording medium in one

of a printing mode and a non-printing mode based on a selection from a user,

wherein a still image is recordable in the non-printing mode.

Page 18 of 25

36. (PREVIOUSLY PRESENTED) The digital camera of claim 5, further

comprising a recording mode selector for selecting for an image recording mode

one of a printing mode and a non-printing mode based on a selection from a

user, wherein a still image is recordable in the non-printing mode.

37. (PREVIOUSLY PRESENTED) The digital camera of claim 5, wherein

when the image data is obtained by photographing the image, the image data is

obtained without a need for conversion from a negative image to a positive

image.

38. (PREVIOUSLY PRESENTED) The digital camera of claim 5, wherein

the photographing means includes an adjustable focusing mechanism capable

of adjustably focusing the image prior to photographing the image.
